## Homework 4 COSE212, Fall 2019

## Hakjoo Oh

Due: 11/25, 23:59

**Problem 1** (100pts) Let us design and implement an imperative language, called B, which is a subset of the C programming language. The syntax of B is as follows:

```
e \ \rightarrow \ \mathrm{unit}
                                                          unit
        x := e
                                                          assignment
        e ; e
                                                          sequence
        \quad \text{if } e \text{ then } e \text{ else } e
                                                          branch
        while e do e
                                                          while loop
        write e
                                                          output
        let x := e in e
                                                          variable binding
        let proc f(x_1, x_2, \dots, x_n) = e in e
                                                          procedure binding
        f(e_1,e_2,\cdots,e_n)
                                                          call by value
        f < x_1, x_2, \cdots, x_n >
                                                          call by reference
                                                          integer
         true | false
                                                          boolean
         \{\} \mid \{x_1 := e_1, x_2 := e_2, \cdots, x_n := e_n\}
                                                          record (i.e., struct)
                                                          record lookup
        e.x
        e.x := e
                                                          record assignment
                                                          identifier
         e+e\mid e-e\mid e*e\mid e/e arithmetic operation e<e\mid e=e\mid not e boolean operation
```

A program is an expression. Expressions include unit, assignments, sequences, conditional expressions (branch), while loops, read, write, let expressions, let expressions for procedure binding, procedure calls (by either call-by-value or call-by-reference), integers, boolean constants, records (i.e., structs), record lookup, record assignment, identifier, arithmetic expressions, and boolean expressions. Note that procedures may have multiple arguments. The language manipulates the following values:

$$x,y \in Id$$
 identifier (variable)  
 $l \in Addr$  address (memory location)  
 $n \in \mathbb{Z}$  integer  
 $b \in \mathbb{B} = \{true, false\}$   
 $r \in Record = Id \rightarrow Addr$   
 $v \in Val = \mathbb{Z} + \mathbb{B} + \{\cdot\} + Record$   
 $\sigma \in Env = Id \rightarrow Addr + Procedure$   
 $M \in Mem = Addr \rightarrow Val$   
 $Procedure = (Id \times Id \times \cdots) \times Expression \times Env$ 

A record (i.e., struct) is defined as a (finite) function from identifiers to memory addresses. A value is either an integer, boolean value, unit value (·), or a record. An environment maps identifiers to memory addresses or procedure values. A memory is a finite function from addresses to values. Note that we design B in a way that procedures are not stored in memory, which means that procedures are not first-class values in B. The semantics of the language is defined as follows (Below, we write  $\sigma\{x\mapsto l\}$  and  $M\{l\mapsto v\}$  for the environment  $\sigma$  and memory M extended with the new entries):

$$\begin{split} \text{TRUE} & \frac{}{\sigma,M \vdash \mathsf{true} \Rightarrow true,M} & \text{FALSE} \frac{}{\sigma,M \vdash \mathsf{false} \Rightarrow false,M} \\ \text{NUM} & \frac{}{\sigma,M \vdash \mathsf{n} \Rightarrow n,M} & \text{UNIT} \frac{}{\sigma,M \vdash \mathsf{unit} \Rightarrow \cdot,M} \\ \text{VAR} & \frac{}{\sigma,M \vdash x \Rightarrow M(\sigma(x)),M} & \text{RECF} \frac{}{\sigma,M \vdash \{\} \Rightarrow \cdot,M} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow v_1,M_1} \\ & \sigma,M_1 \vdash e_2 \Rightarrow v_2,M_2 \\ & \vdots \\ & \frac{}{\sigma,M_{n-1} \vdash e_n \Rightarrow v_n,M_n} \\ \text{RECT} & \frac{}{\sigma,M \vdash \{x_1 := e_1,\cdots,x_n := e_n\} \Rightarrow} \forall i.\ l_i \notin Dom(M_n) \\ & \{x_1 \mapsto l_1,\cdots,x_n \mapsto l_n\},M_n\{l_1 \mapsto v_1,\cdots,l_n \mapsto v_n\} \\ & \text{ADD} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \text{ADD} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \text{SUB} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \text{MUL} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \text{DIV} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \text{DIV} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \text{DIV} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \text{DIV} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \text{DIV} & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_1 \Rightarrow n_1,M'} & \sigma,M' \vdash e_2 \Rightarrow n_2,M''} \\ & \frac{}{\sigma,M \vdash e_$$

 $\begin{array}{c} \sigma, M \vdash e_1 \Rightarrow true, M' \\ \text{WHILET} \ \frac{\sigma, M' \vdash e_2 \Rightarrow v_1, M_1 \qquad \sigma, M_1 \vdash \mathtt{while} \ e_1 \ \mathtt{do} \ e_2 \Rightarrow v_2, M_2 \\ \hline \sigma, M \vdash \mathtt{while} \ e_1 \ \mathtt{do} \ e_2 \Rightarrow v_2, M_2 \end{array}$ 

$$\begin{array}{c} \sigma, M \vdash e_1 \Rightarrow v, M' \\ \text{LETV} & \frac{\sigma\{x \mapsto l\}, M'\{l \mapsto v\} \vdash e_2 \Rightarrow v', M''}{\sigma, M \vdash \text{let } x := e_1 \text{ in } e_2 \Rightarrow v', M''} \ l \not\in Dom(M') \\ \\ \text{LETF} & \frac{\sigma\{f \mapsto \langle (x_1, \cdots, x_n), e_1, \sigma \rangle\}, M \vdash e_2 \Rightarrow v, M'}{\sigma, M \vdash \text{let proc } f(x_1, \cdots, x_n) = e_1 \text{ in } e_2 \Rightarrow v, M'} \\ \\ \sigma, M \vdash \text{let proc } f(x_1, \cdots, x_n) = e_1 \text{ in } e_2 \Rightarrow v, M' \\ \\ \sigma, M \vdash e_1 \Rightarrow v_1, M_1 \\ \sigma, M_1 \vdash e_2 \Rightarrow v_2, M_2 \\ \vdots \\ \sigma, M_{n-1} \vdash e_n \Rightarrow v_n, M_n \\ \sigma'\{x_1 \mapsto l_1\} \cdots \{x_n \mapsto l_n\} \{f \mapsto \langle (x_1, \cdots, x_n), e', \sigma' \rangle\}, \\ \\ \text{CALLV} & \frac{M_n\{l_1 \mapsto v_1\} \cdots \{l_n \mapsto v_n\} \vdash e' \Rightarrow v', M'}{\sigma, M \vdash f(e_1, \cdots, e_n) \Rightarrow v', M'} & \sigma(f) = \langle (x_1, \cdots, x_n), e', \sigma' \rangle \\ \\ \sigma'\{x_1 \mapsto \sigma(y_1)\} \cdots \{x_n \mapsto \sigma(y_n)\} \{f \mapsto \langle (x_1, \cdots, x_n), e, \sigma' \rangle\}, \\ \\ \text{CALLR} & \frac{\sigma'\{x_1 \mapsto \sigma(y_1)\} \cdots \{x_n \mapsto \sigma(y_n)\} \{f \mapsto \langle (x_1, \cdots, x_n), e, \sigma' \rangle\}, \\ \\ \text{CALLR} & \frac{\sigma, M \vdash e \Rightarrow v, M'}{\sigma, M \vdash f \triangleleft y_1, \cdots, y_n \geqslant v, M'} \\ \\ \text{WRITE} & \frac{\sigma, M \vdash e \Rightarrow n, M'}{\sigma, M \vdash \text{write } e \Rightarrow n, M'} \\ \end{array}$$

In OCaml, the language and values can be defined as follows:

```
type exp =
  | NUM of int | TRUE | FALSE | UNIT
  | VAR of id
  | ADD of exp * exp
  | SUB of exp * exp
  | MUL of exp * exp
  | DIV of exp * exp
  | EQUAL of exp * exp
  | LESS of exp * exp
  | NOT of exp
  | SEQ of exp * exp
                                    (* sequence *)
                                   (* if-then-else *)
  | IF of exp * exp * exp
  | WHILE of exp * exp
                                   (* while loop *)
                             (* variable binding *)
  | LETV of id * exp * exp
  | LETF of id * id list * exp * exp (* procedure binding *)
  | CALLV of id * exp list
                                (* call by value *)
  | CALLR of id * id list
                                    (* call by reference *)
                                (* record construction *)
  | RECORD of (id * exp) list
  | FIELD of exp * id
| ASSIGN of id * exp
                                    (* access record field *)
                                    (* assgin to variable *)
  | ASSIGNF of exp * id * exp
                                    (* assign to record field *)
```

```
| WRITE of exp
and id = string

type loc = int
type value =
| Num of int
| Bool of bool
| Unit
| Record of record
and record = (id * loc) list
type memory = (loc * value) list
type env = binding list
and binding = LocBind of id * loc | ProcBind of id * proc
and proc = id list * exp * env
```

1. (70pts) Implemente the function runb:

```
runb : exp -> value
```

which takes a program expression and computes its value. Whenever the semantics is undefined, raise the exception UndefinedSemantics.

Examples:

• The program

```
let ret = 1 in
let n = 5 in
while (0 < n) {
    ret := ret * n;
    n := n - 1;
};
ret
is represented by
LETV ("ret", NUM 1,
    LETV ("n", NUM 5,
        SEQ (
            WHILE (LESS (NUM O, VAR "n"),
                SEQ (
                    ASSIGN ("ret", MUL (VAR "ret", VAR "n")),
                    ASSIGN ("n", SUB (VAR "n", NUM 1))
                )
            ),
            VAR "ret")))
```

and produces 120.

• The program

```
let proc f (x1, x2) =
     x1 := 3;
     x2 := 3;
 in
 let x1 = 1 in
 let x2 = 1 in
 f <x1, x2>;
 x1 + x2
 is represented by
 LETF ("f", ["x1"; "x2"],
     SEQ (
          ASSIGN ("x1", NUM 3),
          ASSIGN ("x2", NUM 3)
     ),
     LETV("x1", NUM 1,
          LETV("x2", NUM 1,
              SEQ(
                  CALLR ("f", ["x1"; "x2"]),
                  ADD(VAR "x1", VAR "x2")))))
 and produces 6.
• The program
 let f = \{x := 10, y := 13\} in
 let proc swap (a, b) =
     let temp = a in
     a := b;
     b := temp
 in
 swap (f.x, f.y);
 f.x
 is represented by
 LETV ("f", RECORD ([("x", NUM 10); ("y", NUM 13)]),
     LETF ("swap", ["a"; "b"],
          LETV ("temp", VAR "a",
              SEQ (
                  ASSIGN ("a", VAR "b"),
                  ASSIGN ("b", VAR "temp"))),
              CALLV("swap", [FIELD (VAR "f", "x"); FIELD (VAR "f", "y")]),
              FIELD (VAR "f", "x")
          )
     )
 )
```

and produces 10.

2. (30pts) Implement the function

which takes an environment and a memory, and performs garbage collection (i.e. recycling memory locations that will not be used in the remaining program execution).
